

SportVue MCx Re-Binding Procedure

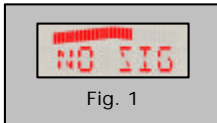

Fig. 1

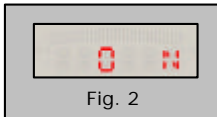

Fig. 2

To “re-bind” your SportVue HMD to your motorcycle sending unit (MSU), follow the procedures below.

Make sure you can access your MSU (typically located under the seat). In addition, turn off the HMD (hold down button for 3 seconds) and make sure the unit is within ten feet of the MSU during the binding process.

- 1) Turn off the motorcycle ignition switch so that there is no power to the MSU. The blue LED on the MSU will not be illuminated.
- 2) Turn on the motorcycle ignition switch but do not start the engine. The blue LED on the MSU will illuminate.
- 3) Turn on the HMD by pressing the button on top of the unit. Make sure that the HMD shows “NO SIG” and that the bar graph is scrolling. (fig. 1)
- 4) Firmly press and hold the “A” and “B” buttons on the MSU at the same time for 2 seconds, then release. The blue LED will blink during binding on some units.

The binding process can take up to 4 minutes to complete but the average time is around 2 minutes.

When binding has successfully completed the HMD will show “**O N**” (fig. 2)

If no binding occurs, the HMD will turn itself off after searching all of the available channels. If the HMD and the MSU are unable to bind it is recommended that you try the process at least two (2) more times. If the unit still displays “NO SIG”, contact technical@sportvue.com for assistance.
